Analyzing NAEP and TIMSS Data with Direct Estimation using the R packages EdSurvey and Dire

Presenters: Paul Bailey, Ting Zhang, Michael Lee & Sinan Yavuz

April 2022

Workshop Goal

Provide participants with an overview of the plausible values and direct estimation methods used to analyze national and international large-scale assessment data using the R package EdSurvey and Dire.

Follow along in edsurvey_part2_Script.R

Outline of EdSurvey Workshop - Part 2

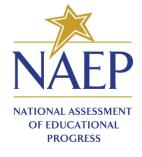

- 1. Descriptive statistics
- 2. Hands-on practice
- 3. Direct estimation with EdSurvey and Dire
- 4. Hands-on practice

Data Processing

• First, load the **EdSurvey** package and read in the data

```
# to load the package
library(EdSurvey)
library(Dire)
```

NAEP Primer:

summary2() produces both weighted and unweighted descriptive statistics for a variable. **summary2()** takes four following arguments in order:

- data : an EdSurvey object.
- variable: name of the variable you want to produce statistics on.
- weightVar : name of the weight variable; or NULL if users want to produce unweighted statistics.
- omittedLevels: if TRUE, the function will remove omitted levels for the specified variable before producing descriptive statistics. If FALSE, the function will include omitted levels in the output statistics.

For a continuous variable (i.e., composite Math score):

• For NAEP data and other datasets that have default weight variable, summary2 produces weighted statistics by default. If specified, variable is a plausible value and weight option is selected, summary2 statistics account for both plausible value pooling and weighting.

```
summary2(sdf, "composite")

## Estimates are weighted using the weight variable 'origwt'

## Variable N Weighted N Min. 1st Qu. Median Mean 3rd Qu. Max. SD NA's Zero weights
## 1 composite 16915 16932.46 126.11 251.9626 277.4784 275.8892 301.1827 404.184 36.5713 0 0
```

For a continuous variable (i.e., composite Math score):

• By specifying weightVar = NULL, the function prints out unweighted descriptive statistics for variable, or each plausible value if variable is a plausible value name.

```
summary2(sdf, "composite", weightVar = NULL)

## Estimates are not weighted.

## Variable N Min. 1st Qu. Median Mean 3rd Qu. Max. SD NA's

## 1 mrpcm1 16915 130.53 252.0600 277.33 275.8606 300.7200 410.80 35.89864 0

## 2 mrpcm2 16915 124.16 252.2100 277.33 275.6399 300.6900 408.58 36.08483 0

## 3 mrpcm3 16915 115.09 252.0017 277.19 275.6570 300.5600 398.17 36.09278 0

## 4 mrpcm4 16915 137.19 252.4717 277.44 275.7451 300.5767 407.41 35.91078 0

## 5 mrpcm5 16915 123.58 252.4900 277.16 275.6965 300.5000 395.96 36.10905 0
```

For a categorical variable (i.e., frequency of students talking about studies at home):

• By default, omittedLevels is set to FALSE. That is, the function includes omitted levels of the variable b017451 in the output statistics.

```
summary2(sdf, "b017451")

```

edsurveyTable(): creates a summary table of outcome and categorical variables. There are 3 important arguments as followed:

- formula: typically written as a ~ b + c, in which:
 - a: a continuous variable (optional) that the function will return weighted mean on.
 - b and c: categorical variable(s) that the function will run cross-tabulation on; multiple crosstab categorical variables can be separated using + symbol.
- data: an EdSurvey object
- pctAggregationLevel: a numeric value (i.e., 0, 1, 2) that indicates the level of aggregation in the cross-tabulation result's percentage column.

- Summary table of NAEP composite mathematics performance scale scores (composite) of 8th grade students by two student factors:
 - dsex: gender
 - o b017451: frequency of talk about studies at home

```
es1 <- edsurveyTable(composite ~ dsex + b017451, data = sdf)
```

• pctAggregationLevel is by default set to NULL (or 1). That is, the PCT column adds up to 100 within each level of the first categorical variable dsex.

dsex	b017451	N	WTD_N	PCT	SE(PCT)	MEAN	SE(MEAN)
Male	Never or hardly ever	2350	2434.844	29.00978	0.6959418	270.8243	1.057078
Male	Once every few weeks	1603	1638.745	19.52472	0.5020657	275.0807	1.305922
Male	About once a week	1384	1423.312	16.95795	0.5057265	281.5612	1.409587
Male	2 or 3 times a week	1535	1563.393	18.62694	0.4811497	284.9066	1.546072

• By specifying pctAggregationLevel = 0, the PCT column adds up to 100 across the entire sample.

Self-Reflection - edsurveyTable

Ask yourself: Use EdSurvey functions to create a summary table using edsurveyTable with these parameters:

- overall math performance across subscales (composite)
- variable that has to do with IEP status
- variable that has to do with number of books at home

Self-Reflection - edsurveyTable

Scenario Result:

```
edexercise <- edsurveyTable(composite ~ iep + b013801,
                                              weightVar = 'origwt', data = sdf)
 edexercise
## Formula: composite ~ iep + b013801
## Plausible values: 5
## jrrIMax: 1
## Weight variable: 'origwt'
## Variance method: jackknife
## JK replicates: 62
## full data n: 17606
## n used: 16351

Linear Regression with PVs

Linear Regression with PVs - lm.sdf()

lm.sdf(): fits a linear model formula using sampling weights and a
variance estimation method. The format is:

```
myfit <- lm.sdf(formula, data, weightVar, varMethod,
relevels)</pre>
```

- formula: model to be fit.
- data: data frame containing the data to be used in fitting the model.
- weightVar: indicates the weight variable to use.
- **varMethod**: the variance estimation method (Jackknife or Taylor series) with the Jackknife as the default.
- relevels: is used when the user wants to change the reference level of a categorical variable.

Linear Regression with PVs - lm.sdf()

The resulting object (myfit in this case) is a list containing extensive information about the fitted model.

Formula notation is typically written as:

$$Y \sim X1 + X2 + \dots + Xk$$

- The ~ separates the response variable on the left from the predictor variables on the right.
- The + sign separates the predictor variables.

Regressions with PVs - lm.sdf()

Composite = β_0 +

 eta_1 Freq. of talk about studies at home + ϵ

Self-Reflection - lm.sdf

Ask yourself: Use EdSurvey functions to perform a regression with multiple predictors using lm.sdf using these parameters:

- overall math performance across subscales (composite)
- variable that has to do with computers at home
- variable that has to do with language other than English spoken in home

Self-Reflection - lm.sdf

Scenario Result:

```
lmexercise2 <- lm.sdf(composite ~ b017101 + b018201,</pre>
                              weightVar = 'origwt', data = sdf)

Direct estimation with EdSurvey and Dire

Direct Estimation with EdSurvey - mml.sdf

- The mml.sdf function in EdSurvey enables marginal maximum likelihood estimation (MML) of linear models for NAEP and TIMMS.
- mml.sdf was designed to automate weighting and complex design calculation with simple steps. The direct estimation can be done in EdSurvey with a simplified operation via the mml.sdf function
- Item parameters, scoring, scaling and weighting information were grabbed from existing NAEP documents, and multiple procedures were streamlined and calculated behind the scene automatically.
- Plausible values (PVs) can be drawing from the latent distribution with drawPVs.

Draw PVs with EdSurvey - drawPVs

- The drawPVs requires two data sources:
 - an edsurvey.data.frame (in this case, the primer data sdf), and
 - a fit from a call to mml.sdf or a summary of mml.sdf call (i.e., mmlA from the example).
- The npv argument specifies the number of PVs for the scale.

```
sdf2 <- drawPVs(sdf, mmlA, npv=20L)

## Warning in (function (data, varnames = NULL, drop = FALSE, dropUnusedLevels = TRUE, : U

## are multiples of the label 'Correct'.

## Warning in (function (data, varnames = NULL, drop = FALSE, dropUnusedLevels = TRUE, : U

## are multiples of the label 'Correct'.

## Calculating posterior distribution for construct algebra (1 of 5)

## Calculating posterior distribution for construct data (2 of 5)</pre>
```

Use new PVs with EdSurvey - drawPVs

- The new plausible values variables end with _dire
- these can be used to fit a regression with any combination of conditioning variables
- variables must be included in the conditioning model (mml.sdf call) for the estimator to be unbiased

```
lm2 <- lm.sdf(composite_dire ~ b013801, data=sdf2)
summary(lm2)

##

## Formula: composite_dire ~ b013801

##

## Weight variable: 'origwt'

## Variance method: jackknife</pre>
```

Use new PVs with EdSurvey - drawPVs

- Variables not included in the conditioning model (mml.sdf call) will have biased estimates
- this includes interaction terms

```

Self-Reflection - mml.sdf

Ask yourself: Use EdSurvey functions to perform Direct Estimation with multiple predictors using mml.sdf using these parameters:

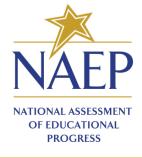

- algebra math performance across subscales (composite)
- variable that has to do with attendance/absence
- variable(s) that has to do with effort on the test

Self-Reflection - mml.sdf

Scenario Result:

```
mmlExercise1 <- mml.sdf(algebra ~ b018101 + m815401 + m815501, data = sdf): These items were in the assessment, but not in your flow of the same of the same
```

Data Synthesis Example

Direct Estimation with Dire

The **Dire** package enables MML linear model and PVs generation for assessment data.

It is flexible for data linking or data frame expanding (e.g., adding Principle Component variables).

Multiple steps required:

- Process the data, link datasets if needed
- Prepare necessary arguments for item, location, scale and weight parameters
- Run MML regression
- Summary of the fitted results with the Taylor series method
- Draw PVs

Data Processing and Exploration

The NAEPDataSimulation package includes a simulated NAEP-like dataset. This dataset was generated by using the NAEP 2015 Mathematics 8 grade item parameters and block design.

Data Linking

- We will merge a data from The US Census Bureau and the simulated NAEP-like data.
- However, the possibilities are endless as long as there is a common variable to combine datasets from different resources.
- From the selection of data provided by The US Census Bureau we choose the following variable from American Community Survey (ACS) 5-Year Data (2009-2020) dataset:

B06011_001E: Median income in the past 12 months (in 2019 inflationadjusted dollars) by place of birth in the United States

• The dataset and all other variables can be found here. https://api.census.gov/data/2019/acs/acs5/variables.html

Data Linking - Download the external dataset

Because the dataset is publicly available it can be directly downloaded as follows:

```
url="https://api.census.gov/data/2019/acs/acs5?get=NAME,B06011 001E&
 temp <- tempfile()</pre>
 download.file(url , temp)
AcsDt <- read.table(temp, sep=",",header = TRUE)</pre>
 unlink(temp)
head(AcsDt)
       X..NAME B06011_001E state zip.code.tabulation.area. X
## 1 [ZCTA5 01001

                          25
                                            010011 NA
## 2 [ZCTA5 01002
                   17716
                                            01002] NA
## 3 [ZCTA5 01003
                  4054
                          25
                                            01003] NA
## 4 [ZCTA5 01005
                          25
                                            01005] NA
                   39944
## 5 [ZCTA5 01007
                          25
                   43144
                                            01007] NA
## 6 [ZCTA5 01008
                   41458
                          25
                                            01008] NA
```

Data Linking - Clean up the ACS data

• Before merging, we need to clean the brackets and replace the missing values with NA. Additionally, we will divide the median income variable by 10,000 for quicker convergence and more readible coefficients.

```
#remove the opening bracket on the first column
AcsDt[,1] <- qsub(pattern="\\[", replacement="", x= AcsDt[,1])
#remove the last empty column
AcsDt$X <- NULL
#remove the bracket from the last column
AcsDt[,ncol(AcsDt)] <- qsub(pattern="\\]",</pre>
                               replacement="", x= AcsDt[,ncol(AcsDt)])
AcsDt$B06011 001E[AcsDt$B06011 001E==-666666666] <- NA
AcsDt$B06011 001E <- as.numeric(AcsDt$B06011 001E)</pre>
## Warning: NAs introduced by coercion
AcsDt$B06011 001E 10K <- AcsDt$B06011 001E/10000
```

Data Linking - The ACS data

```

Self Reflection

- 1. Select a variables from ACS
- 2. Write your url
- 3. Download your ACS data
- 4. Clean up and scale your variable as needed
- 5. Merge with the simulated NAEP-like dataset
- 6. Build your own model(composite ~ ACSvariable +
 simulatedDataVariable)
- 7. Summarize the results
- 8. Draw new PVs

Self Reflection - Step 1: Select a variables

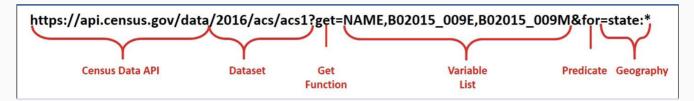

- Select a variable of your interest below:
 - B01001_001E (population)
 - B10063_002E : Household with grandparents living with grandchildren:
 - B19001_017E: Past 12 months income \$200,000 or more
 - B27001_014E : Male 26 to 34 years with no health insurance coverage
 - B28010_007E : No Computer
 - B28011_008E : No Internet access
 - C16001_002E : Speak only English

For more variables: from

https://api.census.gov/data/2019/acs/acs5/variables.html

Self Reflection - Step 2: Write your url

• Add your variable(s) to your *url* link

Source and more information

• Here is the set of links:

```
url1 = "https://api.census.gov/data/2019/acs/acs5?get=NAME,B01001_00
url2 = "https://api.census.gov/data/2019/acs/acs5?get=NAME,B01001_00
url3 = "https://api.census.gov/data/2019/acs/acs5?get=NAME,B01001_00
url4 = "https://api.census.gov/data/2019/acs/acs5?get=NAME,B01001_00
url5 = "https://api.census.gov/data/2019/acs/acs5?get=NAME,B01001_00
url6 = "https://api.census.gov/data/2019/acs/acs5?get=NAME,B01001_00
```

Self Reflection - Step 3. Download your ACS data

• Change your *url* name below (if you selected a different variable)

```
temp <- tempfile()</pre>
 download.file(url6 , temp)
 AcsDt6 <- read.table(temp, sep=",",header = TRUE)</pre>
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec, : number of items read is not a multiple of the
## number of columns
 unlink(temp)
 head(AcsDt6)
        X..NAME B01001 001E C16001 002E state zip.code.tabulation.area. X

                                               :72.00
```

Self Reflection - Step 4. Clean your ACS data and scale

```
AcsDt6$EngSpeakers <- AcsDt6$C16001_002E/AcsDt6$B01001_001E
summary(AcsDt6$EngSpeakers)

## Min. 1st Qu. Median Mean 3rd Qu. Max. NA's
## 0.0000 0.8105 0.8945 0.8380 0.9325 1.0000 344
```

Self Reflection - Step 5. Merge with the simulated NAEP-like dataset

• Here we merge two datasets.

• Don't forget to rebind attributes of the edsurvey.data.frame.

```
linkAtt6 <- rebindAttributes(linkedData6, sNl)</pre>
```

Self Reflection - Step 6. Build your own model

 Here is an example: composite ~ ACSvariable + simulatedDataVariable

Self Reflection - Step 7. Summarize the results

```
summary(fitSR)
## Call:
## mml.sdf(formula = composite ~ EngSpeakers + dsex + pared, data = linkAtt6,
      weightVar = "origwt", idVar = "idvar")
## Summary Call:
## summary.mml.sdf(object = fitSR)
## Summary:
                          Estimate

## Generating plausible values.
```

Wrap Up

Learning EdSurvey

• Reading vignettes provided in training materials

```
vignette("introduction", package="EdSurvey")
```

• R help

```
help(package = "EdSurvey")
```

- EdSurvey eBook
- EdSurvey Website
- EdSurvey Github
- NAEP Data Training workshop

Under development

- Package is still under development
 - Subsequent releases of the EdSurvey package will provide additional functionality for NAEP linking errors and direct estimation.
- Your feedback is important to us!
