Analyzing NAEP and TIMSS Data with Direct Estimation using the R packages EdSurvey and Dire

Presenters: Paul Bailey, Ting Zhang, Michael Lee & Sinan Yavuz

April 2022

Workshop Goal

Provide participants with an overview of the plausible values and direct estimation methods used to analyze national and international largescale assessment data using the R package EdSurvey and Dire.

Follow along in edsurvey_part2_Script.R

Outline of EdSurvey Workshop - Part 2

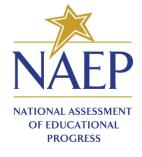

- 1. Descriptive statistics
- 2. Hands-on practice
- 3. Direct estimation with EdSurvey and Dire
- 4. Hands-on practice

Data Processing

• First, load the **EdSurvey** package and read in the data

```
# to load the package
library(EdSurvey)
library(Dire)
```

NAEP Primer:

summary2() produces both weighted and unweighted descriptive statistics for a variable. **summary2()** takes four following arguments in order:

- data : an EdSurvey object.
- variable : name of the variable you want to produce statistics on.
- weightVar : name of the weight variable; or NULL if users want to produce unweighted statistics.
- **omittedLevels**: if **TRUE**, the function will remove omitted levels for the specified variable before producing descriptive statistics. If **FALSE**, the function will include omitted levels in the output statistics.

For a continuous variable (i.e., composite Math score):

For NAEP data and other datasets that have default weight variable,
 summary2 produces weighted statistics by default. If specified,
 variable is a plausible value and weight option is selected,
 summary2 statistics account for both plausible value pooling and weighting.

```
summary2(sdf, "composite")

## Estimates are weighted using the weight variable 'origwt'

## Variable N Weighted N Min. 1st Qu. Median Mean 3rd Qu. Max. SD NA's Zero weights

## 1 composite 16915 16932.46 126.11 251.9626 277.4784 275.8892 301.1827 404.184 36.5713 0 0
```

For a continuous variable (i.e., composite Math score):

• By specifying weightVar = NULL, the function prints out unweighted descriptive statistics for variable, or each plausible value if variable is a plausible value name.

```
summary2(sdf, "composite", weightVar = NULL)

## Estimates are not weighted.

## Variable N Min. 1st Qu. Median Mean 3rd Qu. Max. SD NA's

## 1 mrpcm1 16915 130.53 252.0600 277.33 275.8606 300.7200 410.80 35.89864 0

## 2 mrpcm2 16915 124.16 252.2100 277.33 275.6399 300.6900 408.58 36.08483 0

## 3 mrpcm3 16915 115.09 252.0017 277.19 275.6570 300.5600 398.17 36.09278 0

## 4 mrpcm4 16915 137.19 252.4717 277.44 275.7451 300.5767 407.41 35.91078 0

## 5 mrpcm5 16915 123.58 252.4900 277.16 275.6965 300.5000 395.96 36.10905 0
```

For a categorical variable (i.e., frequency of students talking about studies at home):

• By default, **omittedLevels** is set to **FALSE**. That is, the function includes omitted levels of the variable **b017451** in the output statistics.

```
summary2(sdf, "b017451")

```

Cross tabulation

edsurveyTable(): creates a summary table of outcome and categorical variables. There are 3 important arguments as followed:

- formula: typically written as a ~ b + c, in which:
 - **a**: a continuous variable (optional) that the function will return weighted mean on.
 - **b** and **c**: categorical variable(s) that the function will run cross-tabulation on; multiple crosstab categorical variables can be separated using **+** symbol.
- data: an EdSurvey object
- **pctAggregationLevel**: a numeric value (i.e., 0, 1, 2) that indicates the level of aggregation in the cross-tabulation result's percentage column.

Cross tabulation

- Summary table of NAEP composite mathematics performance scale scores (composite) of 8th grade students by two student factors:
 - dsex: gender
 - b017451: frequency of talk about studies at home

```
es1 <- edsurveyTable(composite ~ dsex + b017451, data = sdf)
```

• pctAggregationLevel is by default set to NULL (or 1). That is, the PCT column adds up to 100 within each level of the first categorical variable dsex.

| dsex | b017451 | N | WTD_N | PCT | SE(PCT) | MEAN | SE(MEAN) |
|------|----------------------|------|----------|----------|-----------|----------|----------|
| Male | Never or hardly ever | 2350 | 2434.844 | 29.00978 | 0.6959418 | 270.8243 | 1.057078 |
| Male | Once every few weeks | 1603 | 1638.745 | 19.52472 | 0.5020657 | 275.0807 | 1.305922 |
| Male | About once a week | 1384 | 1423.312 | 16.95795 | 0.5057265 | 281.5612 | 1.409587 |
| | | | | | | | |

Cross tabulation

• By specifying pctAggregationLevel = 0, the PCT column adds up to 100 across the entire sample.

es2 <- edsurveyTable(composite ~ dsex + b017451, data = sdf, pctAggregation

| dsex | b017451 | N | WTD_N | РСТ | SE(PCT) | MEAN | SE(MEAN) |
|--------|----------------------|------|----------|-----------|-----------|----------|----------|

Self-Reflection - edsurveyTable

Ask yourself: Use EdSurvey functions to create a summary table using edsurveyTable with these parameters:

- overall math performance across subscales (composite)
- variable that has to do with IEP status.
- variable that has to do with number of books at home

Self-Reflection - edsurveyTable

Scenario Result:

```
edexercise <- edsurveyTable(composite ~ iep + b013801,
                                               weightVar = 'origwt', data = sdf)
 edexercise
##
## Formula: composite ~ iep + b013801
##
## Plausible values: 5
## jrrIMax: 1
## Weight variable: 'origwt'
## Variance method: jackknife
## JK replicates: 62
## full data n: 17606
## n used: 16351
##
  Summary Table:

Linear Regression with PVs

Linear Regression with PVs - lm.sdf()

lm.sdf() : fits a linear model formula using sampling weights and a variance estimation method. The format is:

myfit <- lm.sdf(formula, data, weightVar, varMethod,
relevels)</pre>

- formula: model to be fit.
- data: data frame containing the data to be used in fitting the model.
- weightVar: indicates the weight variable to use.
- **varMethod**: the variance estimation method (Jackknife or Taylor series) with the Jackknife as the default.
- **relevels**: is used when the user wants to change the reference level of a categorical variable.

Linear Regression with PVs - lm.sdf()

The resulting object (**myfit** in this case) is a list containing extensive information about the fitted model.

Formula notation is typically written as:

$$Y \sim X1 + X2 + \ldots + Xk$$

- The ~ separates the response variable on the left from the predictor variables on the right.
- The + sign separates the predictor variables.

Regressions with PVs - lm.sdf()

Composite = β_0 +

 eta_1 Freq. of talk about studies at home + ϵ

Self-Reflection - lm.sdf

Ask yourself: Use EdSurvey functions to perform a regression with multiple predictors using **lm.sdf** using these parameters:

- overall math performance across subscales (composite)
- variable that has to do with computers at home
- variable that has to do with language other than English spoken in home

Self-Reflection - lm.sdf

Scenario Result:

```
lmexercise2 <- lm.sdf(composite ~ b017101 + b018201,</pre>
                              weightVar = 'origwt', data = sdf)

Direct estimation with EdSurvey and Dire

Direct Estimation with EdSurvey

mml.sdf

- The mml.sdf function in EdSurvey enables marginal maximum likelihood estimation (MML) of linear models for NAEP and TIMMS.
- mml.sdf was designed to automate weighting and complex design calculation with simple steps. The direct estimation can be done in EdSurvey with a simplified operation via the mml.sdf function
- Item parameters, scoring, scaling and weighting information were grabbed from existing NAEP documents, and multiple procedures were streamlined and calculated behind the scene automatically.
- Plausible values (PVs) can be drawing from the latent distribution with drawPVs.

Direct Estimation with EdSurvey

mml.sdf

```
mmlA <- mml.sdf(composite ~ dsex + b013801, data=sdf)</pre>
```

```

Draw PVs with EdSurvey drawPVs

- The drawPVs requires two data sources:
 - o an **edsurvey.data.frame** (in this case, the primer data **sdf**), and
 - o a fit from a call to mml.sdf or a summary of mml.sdf call (i.e., mmlA from the example).
- The npv argument specifies the number of PVs for the scale.

```
sdf2 <- drawPVs(sdf, mmlA, npv=20L)

## Warning in (function (data, varnames = NULL, drop = FALSE, dropUnusedLevels = TRUE, : Updatin

## are multiples of the label 'Correct'.

## Warning in (function (data, varnames = NULL, drop = FALSE, dropUnusedLevels = TRUE, : Updatin

## are multiples of the label 'Correct'.

## Calculating posterior distribution for construct algebra (1 of 5)</pre>
```

Use new PVs with EdSurvey drawPVs

- The new plausible values variables end with _dire
- these can be used to fit a regression with any combination of conditioning variables
- variables must be included in the conditioning model (mml.sdf call) for the estimator to be unbiased

```
lm2 <- lm.sdf(composite_dire ~ b013801, data=sdf2)
summary(lm2)

##

## Formula: composite_dire ~ b013801

##

## Weight variable: 'origwt'

## Variance method: jackknife</pre>
```

Use new PVs with EdSurvey drawPVs

- Variables not included in the conditioning model (mml.sdf call) will have biased estimates
- this includes interaction terms

```
lm1a <- lm.sdf(composite ~ b018201, data=sdf2)</pre>
 summary(lm1a)$coefmat

Self-Reflection - mml.sdf

Ask yourself: Use EdSurvey functions to perform Direct Estimation with multiple predictors using mml.sdf using these parameters:

- algebra math performance across subscales (composite)
- variable that has to do with attendance/absence.
- variable(s) that has to do with effort on the test

Self-Reflection - mml.sdf

Scenario Result:

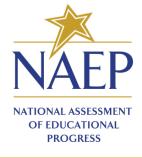

```
mmlExercise1 <- mml.sdf(algebra ~ b018101 + m815401 + m815501, data = sdf)

## Warning in mml.sdf(algebra ~ b018101 + m815401 + m815501, data = sdf): These items were in the assessment, but not in your data:
## m141901, m0732c1, m092601, m092401, m141301, m073601, m140501, m140901, m141501, m052501, m067001, m051701, m140701, m141601,

## Summary Call:</pre>
```

Data Synthesis Example

Direct Estimation with Dire

The **Dire** package enables MML linear model and PVs generation for assessment data.

It is flexible for data linking or data frame expanding (e.g., adding Principle Component variables).

Multiple steps required:

- Process the data, link datasets if needed
- Prepare necessary arguments for item, location, scale and weight parameters
- Run MML regression
- Summary of the fitted results with the Taylor series method
- Draw PVs

Data Processing and Exploration

The **NAEPDataSimulation** package includes a simulated NAEP-like dataset. This dataset was generated by using the NAEP 2015 Mathematics 8 grade item parameters and block design.

```
require(NAEPDataSimulation)
 simNAFP <- NAFPDataSimulation::NAFPlikeDt</pre>
 dim(simNAEP)

```

Data Linking

- We will merge a data from The US Census Bureau and the simulated NAEP-like data.
- However, the possibilities are endless as long as there is a common variable to combine datasets from different resources.
- From the selection of data provided by The US Census Bureau we choose the following variable from American Community Survey (ACS) 5-Year Data (2009-2020) dataset:

B06011_001E: Median income in the past 12 months (in 2019 inflation-adjusted dollars) by place of birth in the United States

• The dataset and all other variables can be found here. https://api.census.gov/data/2019/acs/acs5/variables.html

Data Linking - Download the external dataset

Because the dataset is publicly available it can be directly downloaded as follows:

```
url="https://api.census.gov/data/2019/acs/acs5?get=NAME,B06011 001E&for=zig
 temp <- tempfile()
 download.file(url , temp)
 AcsDt <- read.table(temp, sep=",",header = TRUE)</pre>
### Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec, : number of items read is not a multiple of the
## number of columns

                           25
```

Data Linking - Clean up the ACS data

 Before merging, we need to clean the brackets and replace the missing values with NA. Additionally, we will divide the median income variable by 10,000 for quicker convergence and more readible coefficients.

```
#remove the opening bracket on the first column
AcsDt[,1] <- gsub(pattern="\\[", replacement="", x= AcsDt[,1])
#remove the last empty column
AcsDt$X <- NULL
#remove the bracket from the last column
AcsDt[,ncol(AcsDt)] <- gsub(pattern="\\]", replacement="", x= AcsDt[,ncol(AcsDt)$B06011_001E[AcsDt$B06011_001E==-666666666] <- NA
AcsDt$B06011_001E <- as.numeric(AcsDt$B06011_001E)</pre>
```

Data Linking - The ACS data

Here is the cleaned ACS data

```
head(AcsDt)
        X..NAME B06011 001E state zip.code.tabulation.area.

```

MML Model Preparation

- 1. Gather item parameters
 - use NAEPirtparams::parameters and naepParamTabs
- 2. Provide the test scale information
 - use NAEPirtparams::transformations
- 3. Reshape student data to a long format
 - use reshape

MML Model Preparation - Item

Parameters

The most convenient way to acquire NAEP item parameters is to call **NAEPirtparams** package. From this package item parameters can be gathered as follows:

```
require(NAEPirtparams)
 param <- NAEPirtparams::parameters</pre>
 item par <- param[param$level == 8 & param$subject == "Mathematics" & par
 head(item par)
          source level levelType NAEPid assessmentCode accommodations subtest
                                                                            subject year
                                                                                                             c d1 d2 d3

Self Reflection

- 1. Select a variables from ACS
- 2. Write your url
- 3. Download your ACS data
- 4. Clean up and scale your variable as needed
- 5. Merge with the simulated NAEP-like dataset
- 6. Prepare your data for **Dire**
- 7. Build your own model (composite ~ ACSvariable + simulatedDataVariable)
- 8. Estimate your regression model
- 9. Summarize the results

Self Reflection - Step 1: Select a variables

- Select a variable of your interest below:
 - B01001_001E (population)
 - B10063_002E: Household with grandparents living with grandchildren:
 - B19001_017E: Past 12 months income \$200,000 or more
 - B27001_014E: Male 26 to 34 years with no health insurance coverage
 - B28010_007E : No Computer
 - B28011_008E : No Internet access
 - C16001_002E : Speak only English

For more variables: from

https://api.census.gov/data/2019/acs/acs5/variables.html

Self Reflection - Step 2: Write your url

Add your variable(s) to your url link

Source and more information

Here is the set of links:

Self Reflection - Step 3. Download your ACS data

Change your url name below (if you selected a different variable)

```
temp <- tempfile()
 download.file(url6 , temp)
 AcsDt <- read.table(temp, sep=",",header = TRUE)</pre>
## Warning in scan(file = file, what = what, sep = sep, quote = quote, dec = dec, : number of items read is not a multiple of the
## number of columns
 unlink(temp)
 head(AcsDt)
